Core: C# · ASP.NET Core · .NET Framework 2.0 – .NET 10 · SQL Server · Power Automate

SUMMARY

Building and looking after core back-office systems at a satellite operator (finance approvals, SAP integration, central sign-in) and supporting others across the organisation. Recent work includes moving decade-old platforms to .NET 8 without service interruption.

Much of my work is modernising long-running systems carefully, verifying how each one actually behaves against the database before changing it. Upgrades and migrations then keep the existing business process intact, which matters most where finance and approvals are involved. Some have been in use for around 20 years and still need to keep running; new systems are built on current technology.

EXPERIENCE

Full-stack Developer — Gulf Space Technology (formerly Thaicom PCL)

Dec 2018 – Present

- Migrated decade-old ASP.NET Web Forms systems to .NET 8 and Next.js on the existing database, without service interruption.
- Developed the central SSO on Microsoft Entra ID (OAuth 2.0), building on a proposal from the DevOps team, and worked through moving other applications onto it, replacing each app's separate login.
- Designed a permission layer granting access by organisational attributes (business unit, department, position) rather than per-user assignment; a single rule change propagates to every application behind SSO.
- Designed automation with Power Automate, AI Builder and UiPath for document processing and to work around limits of the SAP ECC6 system.
- Built a web service and flow that syncs employee data into on-premise Active Directory, automating user provisioning and deprovisioning.
- Directed external vendors and outsourced developers: task assignment, code review and acceptance, and escalation with the SAP system vendor.
- Introduced RabbitMQ to queue RPA workloads and a clean-architecture split of .NET API and Next.js front end in place of the old monoliths, after trialling both on real work.
- Brought AI tooling into development — Claude Code with shared skills and a knowledge base colleagues now use — for debugging and reverse-engineering legacy systems, which has made that work noticeably faster.

.NET 8 · ASP.NET Core · ASP.NET Web Forms · Vue.js · Next.js · SQL Server · RabbitMQ · Python · Docker · SAP

Key projects

Most are internal systems, so names and screenshots are withheld. Each is described by what it does, and I'm glad to go deeper in interview.

End-to-end SAP document production pipeline — Re-processed the entire back catalogue (tens of thousands of documents) and diffed every one against its original to zero differences before the new path became the default.

Enterprise access management (rewrite) — Added an ISO-audit reporting set: rule×menu matrix, access comparison between users, orphan-account detection, and audit logging.

SAP integration middleware — Used AI to work out XML queries against the vendor's existing SOAP services to pull the data needed, such as customer records, instead of waiting on the ABAP team for new endpoints.

Budget request & approval system — Validates remaining budget against SAP at submission, rather than at the point the request reaches finance.

Employee identity lifecycle automation — Leaving-day work runs as one scheduled set — disabling the account, reclaiming licences, removing group memberships and setting mail forwarding — instead of being worked through system by system by hand.

Organisation-wide automation — Provides a shared alerting endpoint other systems post to — network-device alerts, document-processing status, stalled mail queues — routed into the responsible team's chat.

Programmer — Bureau of Tuberculosis, Ministry of Public Health	Oct 2017 – Oct 2018
- Developed web applications in C#.NET on .NET Framework 4.5 and wrote the database stored procedures. - Handled business intelligence work using SSAS and Tableau.	
C# · .NET Framework · SQL Server · SSAS · Tableau	
System Development and IT Support Officer — Ramathibodi Facilities Services	Jul 2014 – Sep 2017
Built an IT asset management system, an IT service request system (C#, ASP.NET MVC, Entity Framework) and a seminar registration system.	
C# · ASP.NET MVC · Entity Framework · Active Directory · K2	
IT Technician — SVOA Public Company Limited	Jul 2013 – Mar 2014

SKILLS & TOOLS

Core	C#, TypeScript, SQL, Python, JavaScript
Backend	.NET Framework 2.0 / 3.5 / 4.x, .NET Core 1 – 3.1, .NET 5 / 6 / 8 / 10, ASP.NET Core, ASP.NET Web Forms, Dapper, EF Core, REST, SOAP
Frontend	Vue.js, Next.js, React, Tailwind CSS, HeroUI, HTML/CSS
Databases	SQL Server, MySQL, MariaDB, Oracle
Infra & DevOps	Docker, Portainer, RabbitMQ, Hangfire, Git, GitLab CI, Nginx, Azure Key Vault, Azure Blob Storage
AI engineering	Claude Code, Skills & hooks, MCP servers, Agent workflows, Prompt/context engineering, Automated code review
Enterprise & automation	SAP SOAP services (consumer), Active Directory, Microsoft Entra ID, Microsoft Graph, ServiceNow API, Power Automate, Power Apps, Power Pages, AI Builder, Dataverse, UiPath, Webflow

EDUCATION

B.Sc. Computer Science — King Mongkut's University of Technology North Bangkok	2009 – 2013
Vocational Certificate and Higher Vocational Certificate, Business Computer — Trang Technical College	2004 – 2009

TRAINING & BADGES

Microsoft Learn: Data Engineering on Microsoft Azure, Developing Solutions for Microsoft Azure, Microsoft Azure Security Technologies, Microsoft Power BI Data Analyst
Google Cloud: skill badges — Gemini, multi-agent, RAG, Document AI, Kubernetes and core platform work
